Installing Texmaker (5 points)

Windows

- Download and install MikTeX (this is a latex compiler for windows). **Do not** install to a folder that has any non-english characters in the path, this can mess with a lot of things. Installing to the usual **Program Files** folder is safe.
- Download and install Texmaker (this is the editor we used in class). Again, **do not** install to a folder that has any non-english characters in the path.
- Start Texmaker, create a new file, test your install with the template from practice 6.

Linux

The command

```
sudo apt-get install texmaker
```

should do the install.

- Start Texmaker, create a new file, test your install with the template from practice 6.

Mac

- Download and install MacTeX (this is a latex compiler for mac). **Do not** install to a folder that has any non-english characters in the path, this can mess with a lot of things.
- Download and install Texmaker (this is the editor we used in class). Again, **do not** install to a folder that has any non-english characters in the path.
- Start Texmaker, create a new file, test your install with the template from practice 6.

The homework

Reproduce the following pdf using latex: homework4.pdf. (You can copy and paste most of the text, if somehow you can't, then you can find it here.) In the email attach the .tex and the .pdf files only.
