Tartalomjegyzék

Bash

You have to write a bash script: write commands into a file, similar like the ones in konsole. The commands should do the following:

- Make a directory called `html` in the home folder (**mkdir**)
- enter that directory (**cd**)
- download any `.html` file from the internet, for example <u>here</u> (**wget**)
- count how many lines contain the word **href**
- finally, enter the parent directory (back to home folder)

script

You can try the commands in konsole, and write them in a file with extension `.sh`, attach the `.sh` file to your email.

You can execute the commands in the file at once with **bash**

```
bash >>something.sh<<
```

Hint

See the manuals like:

```
man cd
man wc
man ...
```

Deadline

2019. October 6th 23:59

Points

- If your commands fail, you get 0 points.
- If your commands work but do something else that the task then you get 1 or 2 points.
- Perfect solution is 3 points.
